

Divide airspace in situations where there is the need to separate airflow

Industrial or activity SET UP

While many employees who work in an office have been able to transition to working from home, this is not the case of employees in an industrial and manufacturing environment. The use of machinery, tools, and required access to communal property, makes it essential for these workers to be onsite at their jobs. The Sneeze Buddy™ Social Distance Separation Panel allows for workers to continue performing their duties at the workplace, while also being safe and protected.

Office or public building SET UP

Space division in these settings is perhaps the trickiest to figure out, because these places are often used for a variety of different functions. Sneeze Buddy Panels are light weight and easy to reconfigure and move. This makes them ideal for protecting individual desks or separate workspaces, as well as defining personal space in a public building such as a medical office or municipal facility. Their uses are as flexible as the material that they are made with; the possibilities are endless!

Free Standing Modular Frames

Mounting the Sneeze Buddy Panel to frames allows for them to be used in almost any setting. The frames can have casters on them for ease of moving around a facility. These frames can also be connected to each other to make an "L" shaped, "U" shaped, "W" shaped, or square enclosure. Whether they are needed in a school, office, doctor's office, or anywhere else, there is a frame and a configuration that will meet your needs.
