

Threaded Rod Split Support

Threaded Rod Connector

Retractable Parallel Solution

Height of the top of the track: \_\_\_\_\_ above the finished floor.  
(located on quote form)

**step 1**

First, you will need to attach the Unistrut to the bottom of your trusses.

- a. Unistrut should be positioned so that the side that is open (not one of the sides with holes) is facing into the enclosed area. The three sides with the holes should be facing up against the truss, down toward the ground, and outside of the enclosed space.

**step 2**

To attach the Unistrut to your trusses, use the bolt, washer, and nut sets labeled "S2TR". You should use one "S2TR" set per truss.

- a. The bolt will thread through the space between the bars in your truss and then down through the Unistrut.
- b. You should have one fender washer for the top fo the strut and one fender washer for the bottom of the strut.
- a. Secure the bolt and fender washers with the lock washer and nut provided.

**step 3**

Unistrut should run in one continuous length. To secure one Unistrut to the next, use the flat plate fittings and the bolts with square washers provided.

- a. These plates and bolts should be attached to the Unistrut on the side of the strut that is open (facing into the enclosed space).

**step 4** Once the Unistrut is up, you can attach the threaded rods to it.

The threaded rods are to be attached to the Unistrut by sliding the rods into the strut and out the other side of it.

**step 5**  
a. You should use one each of flat washer, lock washer, and hex nut (labeled "TROD2S"), on each of the Unistrut (one set on top, the other on the bottom).

**step 6** The threaded rods are designed to drop down and connect to your track at the other end (the end not occupied by the beam clamp). Threaded rods come in standard lengths and may need to be cut in the field.

**step 7** The rods should connect to the track - via connectors and split supports - at the other end. Please use 2 nuts per th

**step 8** If your track runs end at existing walls, you can substitute the split supports for wall mount end stops.

a. are to be used at every connection point between two tracks.

**step 9** The threaded rod split supports, which look like this:

a. are designed to hold the ends of each track run or support a curve. The split supports will support the track but will not connect two track pieces together.

step **10** Before putting your last piece of track up, slide the rollers into the track.

step **11** Then, hang the curtains.

step **12** If there are any additional rollers in the track, take them out before putting the last piece of track up.

step **13** If your track runs end at existing walls, you can substitute the split supports for wall mount end stops.
